

Something to Try!

A grey whale calf drinks about 200 litres (50 gallons) of milk a day for about four months. It can gain about 100 kilograms per day (or about 250 pounds).

Using one litre milk containers, pour 200 litres of water into a child's swimming pool to see just how much milk a grey whale calf can drink in a day.

How much milk do you drink in a day? How does this compare with what a grey whale calf drinks?
